### 2. To initialize the unit

This device employs a microprocessor to perform various functions and operations. If interference generated by an external power supply, radio wave, or other electrical source results in accident which causes the specified operations and functions to operate abnormally.

To perform a result, please follow the procedure below.

1. Turn POWER to on.
2. Press and hold down the PRESET MEMORY button, then press the STANDBY button.  
 After "clear" is displayed, the preset memory and each mode stored in the memory, such as surround, are initialized and will return to the factory setting.
3. Disconnect Power supply cord.

### 3. Safety-check out

(Only U.S.A. model)

After correcting the original service problem, perform the following safety check before releasing the set to the customer. Connect the insulating-resistance tester between the plug of power supply cord and screw on the back panel. Specifications: 3.3Mohm+/-10% at 500V.

### 4. Memory Preservation

This unit does not require memory preservation batteries. A built-in memory power back-up system preserves the contents of the memory during power failures and even when the unit is unplugged. The unit must be plugged in order to charge the back-up system.

The memory preservation period after the unit has been unplugged varies depending on climate and placement of the unit. On the average, memory contents are protected over a period of a few weeks after the last time the unit has been unplugged. This period is shorter when the unit is exposed to a highly humid climate.

### 5. Setting the AM tuning step frequency

#### (Worldwide models only)

The initializing setting is 9 kHz, and this needs only to be changed if you are using the unit in a 10-kHz region.

1. Press the SETUP button.  
 Turn the jog dial or press the ▲ and ▼ cursor buttons on the remote controller to display "3. PREFERENCE."
2. Press the jog dial or ENTER button on the remote controller.  
 Turn the jog dial or press the ▼ cursor buttons on the remote controller to display "AM FREQ STEP?".
3. Press the jog dial or ENTER button on the remote controller.  
 The currently set frequency step appears.
4. Turn the jog dial or press the ◀ and ▶ cursor buttons on the remote controller to set the frequency.
5. Press the RETURN button.  
 "AM FREQ STEP?" appears in the FL tube.  
 To exit the setup mode immediately, press the SETUP button.

### 6. Setting the Voltage selector (Worldwide models only)

Worldwide models are equipped with a voltage selector to conform with local power supplies. Be sure to set this switch to match the voltage of the power supply in your area before plugging in the unit.

1. Determine the proper voltage for your area: 220-230 V or 120 V.
2. If the preset voltage is not correct for your area, insert a screwdriver into the groove in the switch. Slide the switch all the way to the right (120 V) or to the left (220-230 V), whichever is appropriate.

### 7. Changing the AM band step

With the exception of the worldwide models, a tuning step setup mode is not provided. When you change the band step, change the parts as shown below.

	To 10kHz	To 9kHz
R7780,R7781	330 ohm	Open
R7880,R7881	Open	2.2 kohm

## ABOUT DEBUG MODE

### 1. How to enter the debug mode

Press and hold down the AUDIO SEL button, then press the STANDBY/ON button to display "DEBUG MODE IN". After 5 second the unit enters the DEBUG mode. When there is the error that can judge by the microprocessor, the error message is displayed for 3 seconds.

DSPREAD ERROR: Problem of interface between DSP and microprocessor.

DSPLOCK ERROR: Problem of lock of DSP IC.

On all occasions the microprocessor resets DSP, and DSP is restarted.

### 2. How to investigate the unit by the debug mode

Apply the signal that the trouble occurs, and compare with the example of display or the normal unit. If there is difference on the display, you are able to check the rejection by the explanation below. If there is not difference, the input signal comes to DSP IC and the format of signal is recognized. Check the signal from the DSP output to the speaker output.

### 3. Explanation of Display

#### 1. DIR ERROR: Check of digital signal of DIR IC (AK4112).

L: There is the digital signal. H: No digital signal.

When apply the digital signal, the display is "L".

Check the circuit from digital input to DIR IC and the connection between ERF (#18) of DIR and microprocessor.

2. DIR STATUS 1: It displays the status of Addr03H that AK4112 reads from the digital signal. It shows the sampling frequency, and pre emphasis etc. When the display is difference to the table below, check the signals of DSPCL and DSPDA to confirm the communication between the microprocessor and CDTO/SCDO(#28) of AK4112.

3. DIR STATUS 2: It displays the status of Addr0DH that AK4112 reads from the digital signal. It shows the constants of input signal (DD,DTS,MPEG etc.). When the display is difference to the table below, check the signals of DSPCL and DSPDA to confirm the communication between the microprocessor and CDTO/SCDO(#28) of AK4112.

#### 4. DIR analog/digital judgment

It displays the result of judgment about input signal by the microprocessor. D: Digital A: Analog

5-7. Addr15 -17 : These displays show the port condition of the flash memory control. "L" except Japanese model.

	DIR ERROR	DIR STATUS1	DIR STATUS2	ANA/DIG	ADDR15	ADDR16	ADDR17	Judgment	DECODE
DOLBY DIGITAL	L	34 or B4	01	D	L	L	H	01	1
MPEG AAC *1	L	34 or B4	07	D	L	H	L	07	1
DTS DVD	L	34 or B4	0B	D	H	L	L	0B	1
PCM 48K	L	04	**	D	L	L	L	23	1
PCM 96K	L	03 or 05	**	D	L	L	H	23	1
ANALOG	L	**	**	A	H	L	H	23	1

\*1: Japanese model only    \*\*: State of last input

### 8. Judgment of DSP input signal

It displays the result of detection about the input signal by DSP IC. Refer to the table below.

When the display differs, check the DSP IC and circumference of DSP IC.

Digital Signal Detection		
DIR	STTS2	DSP
00	00	Null
01	01	Dolby Digital
02	02	Reserved
03	03	Pause
04	04	MPEG1 L1

06	06	MPEG2 w/e
07	07	MPEGAAC
08	08	MPEG2 L1
09	09	MPEG2 L2/3
0A	0A	Reserved
0B	0B	DTS1(512)
0C	0C	DTS2(1024)
0D	0D	DTS3(2048)
	20	Silent
	21	DTS LD
	22	DTS CD
	23	Linear PCM

### 9. DSP DECODE

When there is the input signal in DSP IC.

"1" : When decode the signal.

"0" : When does not decode the signal.

"0" : When there is not the input signal in DSP IC.

When the digital signal is applied in DSP IC, the display is "0".

DSP IC does not operate.

Check the signals to the pins 22, 25, and 26 of DSP IC.

Is there the signal to pin 20 of DIR IC?

## ADJUSTMENTS AND CONFIRMATION PROCEDURES

### Idling current adjustment

Before Idling adjustment, turn the trimming resistors R6040, R6041, R6042, R6043 and R6044 to counter clockwise.

Connect the DC voltmeter to sockets P6080, P6081, P6082, P6083 and P6804.

After turn POWER to ON, adjust the trimming resistors R6040, R6041, R6042, R6043 and R6044 so that the reading of voltmeter becomes 5.0 mV.

After adjustment, attach the top cover.

Confirm the voltage of points above after five minutes.

When less than 6.0 mV, readjust the resistors above so that the voltage becomes 6.0 mV.

When 6.0 mV to 8.0 mV, you are not necessary to adjust.

When more than 8.0 mV, readjust the resistors above so that the voltage becomes 8.0 mV.

Note: No load and No signal

### Confirmation of protection circuit

#### 1. Confirmation of operation of speaker relay

Confirm that the speaker relay turns ON approximate. 5 seconds after the power switch is turned ON.

Confirm that the speaker relay turns OFF immediately after the power switch is turned OFF.

#### 2. Confirmation of DC detection circuit

Connect the shored plug between the both terminals of P5601.

Press and hold down DVD button, then press STANDBY button.

During "TEST-1" on the FL tube light on, press ZONE 2 (TX-DS696) or SPEAKER A (TX-DS595) button.

Apply DC 1.5 to 3V to MULTI CHANNEL INPUT terminal with no load.

Confirm that the speaker relay turns OFF.

Apply DC -1.5 to -3V to MULTI CHANNEL INPUT terminal with no load.

Confirm that the speaker relay turns OFF.

After the adjustment, disconnect the shorted plug.

Caution: Don't apply DC voltage more than 1 sec..

#### 3. Confirmation of Current detection circuit

Connect the shored plug between the both terminals of P5601.

Press and hold down DVD button, then press STANDBY button.

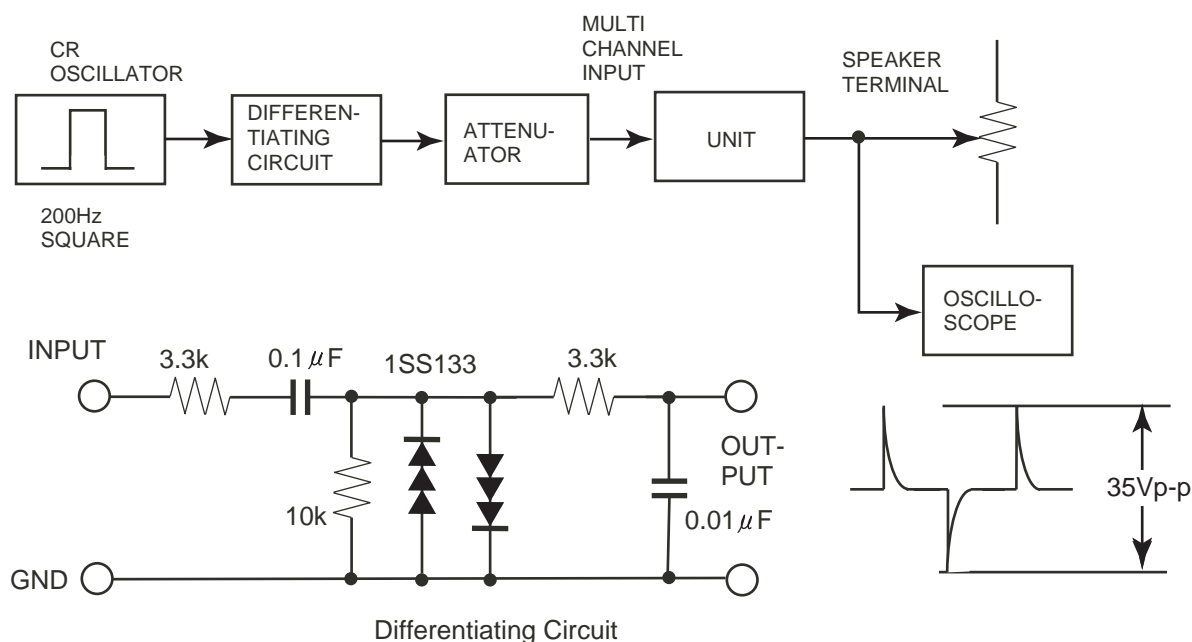

During "TEST-1" on the FL tube light on, press ZONE 2 (TX-DS696) or SPEAKER A (TX-DS595) button.

Connect the differentiating circuit and apply the 200Hz square signal to MULTI CHANNEL INPUT terminal.

Adjust the attenuator or Volume so that the output level becomes 35V p-p.

Confirm that the speaker relay does not turn OFF when a 3.0 ohm load is connected.

Confirm that the speaker relay turns OFF when a 1.5 ohm load is connected.

## Test Mode

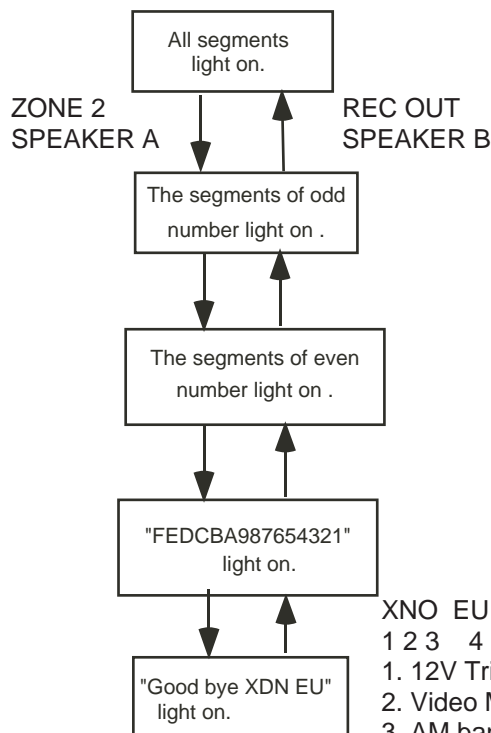

1. Turn POWER button on.
2. Press and hold down DVD button, then press STANDBY button.
3. During "TEST-1" on the FL tube is displayed, press CD button to set the unit to the test mode of FL tube.

Note: VIDEO 1:TEST-1 VIDEO 2 :TEST-2 ZONE2/SP A: UP  
VIDEO 3 :TEST-3 VIDEO 4:TEST-4 REC OUT/SP B: DOWN

### Test mode of FL tube

TX-DS696: Press ZONE 2 or REC OUT button to change the test mode of FL tube.

TX-DS595: Press SPEAKER A or SPEAKER B button to change the test mode of FL tube.

### Confirmation of voltage sensor

1. Set the unit to TEST-3-4.
2. Apply the signal 1kHz, -15dBV to the MULTI-CH input. Confirm that the FM STEREO is displayed. Confirm the all channels except SUBWOFFER.
3. When connect the resistor 1.2 kohm/1 W between the terminals COM and TH1 of P6401, confirm that the spaker relays of RL6901 and RL6902 turn off.  
Note: No input signal.
4. When change SPEAKER IMPEDANCE switch to 4 ohm, confirm that the speaker relays of RL6901 and RL6902 turn off.  
Note: No input signal.

### Confirmation of thermal protect

Set the unit to TEST-1-00 with no input signal. When connect the resistor 1.2 kohm/1 W between the both terminals of P6401, confirm that all speaker relays turn off.

Press POWER button to finish the test mode of FL tube.
